

Senior Resuscitation Test Questions

Name: Daryl Chow

~~7~~

7

Q1. What do you mean by Cardio-respiratory arrest?

1. Cardio-respiratory arrest means respiratory failure
2. Cardio-respiratory arrest causes the oxygen level in the blood to go up progressively until eventually the heart stops.
3. This is known as Cardio-respiratory resuscitation.
4. None of the above

1

✓

Q2. What is Cardiac Arrest?

1. During heart attacks, one or more of the blood vessels which supply blood to the portion of the heart becomes blocked.
2. The heart may not be able to pump properly because part of it is dying, and if a large part of the heart is not getting blood, the heart may not be able to pump at all.
3. When the heart stops pumping, the victim is in cardiac arrest.
4. All the above.

4

✓

Q3. What is shock?

1. Shock is a failure of the blood flows through the capillaries, which provide a continuous supply of nutrients and clearance of waste products for all body cells.
2. Shock will first affect the brain and then the eyes and then all part of the body.
3. Ultimately, life itself may be threatened when in shock.
4. Shock is the feeling of dumbness, anxiety and giddiness.

1

Q4. What is the treatment for shock?

1. The most likely cause of shock is serious bleeding, or a severe burn or scald.
2. Any injuries must be treated immediately.
3. Treat any obvious injuries and reassure the victim.
4. All of the above.

4

✓

Q5. How to treat bleeding?

1. Check if there is an object embedded in the wound, pull it out and cover it.
2. Check the colour of the blood before treatment.
3. If the wound is on an arm or leg raise the injured limb above the level of the heart.
4. If you suspect there is something embedded, call the police and make a report immediately.

Q6. What is hypothermia? (pg 105)

1. Hypothermia, sometimes called the cold exposure, is the name given to the condition of people with a body core temperature below 35°C.
2. The cause of hypothermia is an excessive heat loss due to inadequate protection from wet, cold and windy conditions.
3. Exhaustion and hunger are also contributory factors.
4. All the above.

1

4

Q7. What is Asphyxia?

1. Is a condition in which insufficient or no oxygen and carbon dioxide are exchanged on a ventilatory basis; caused by choking or drowning or electric shock or poison gas.
2. Rapid and irregular heartbeat.
3. Eating too fast is asphyxia.
4. None of the above.

① ✓

Q8. What Are the Symptoms of a Heart Attack?

1. Discomfort, pressure, heaviness, or pain in the chest, arm or below the breastbone
2. Discomfort radiating to the back, jaw, throat or arm with rapid or irregular heartbeats.
3. Fullness, indigestion or choking feeling (may feel like heartburn)
4. All of the above.

① ✓
④

Q9. What is the respiratory system?

The respiratory system refers to the lungs and the associated air-route (air-route / vessels / living cells); it is the system associated with breathing. Breathing is essential because all living cells of the body require oxygen to oxidize (burn) food materials to release energy; the by-products are carbon dioxide and water.

Q10. What is the circulatory system?

The circulatory system refers to the Heart and the Vessels through which the blood circulation (travelling / circulation / pumping).

Q11. How to activate ambulance service and what may cause delay for the ambulance? (Refer to my supplementary notes)

- Step 1 - Dial 9915 for an ambulance ✓
Step 2 - State the address ✓
Step 3 - State the cause ~~number~~ of casualty/casualties ✓
Step 4 - State the condition ~~number~~ of the casualty ✓
Step 5 - Provide phone no. for ambulance to call back for location ✓
Step 6 - Hang up last ~~last~~ so that the operator can ask for more information.

Disconnect

Q12. Describe what is Hyperventilation?

1. Excessive breathing is the practice of taking very deep breaths in succession and is usually as a result of acute anxiety.
2. Unnaturally fast and deep breathing
3. Attention seeker behaviour
4. Dizziness, faintness, trembling, or marked tingling in the hands
5. Cramps in the hands and feet

①

②

Q13. What can CPR really do?

1. CPR may double a person's life when performed properly.
2. CPR will provides oxygenated blood to the brain and heart and keeps these organs alive until the arrival of the defibrillator to shock the heart into normal rhythm
3. If CPR is started within 4 minutes of collapse there is no need to send to hospital.
4. None of the above
